## Demand Paging

## Assignment Project Exam Help

Is main memory always enough?

- Are all pages of all active processes always in main memory?
  - Not necessary, with large address spaces
- OS uses a part of disk (swap space) to store pages that are not in active use

## Assignment Project Exam Help

### Page fault

Add WeChat powcoder

- Present bit in page table entry: indicates if a page of a process resides in memory or not
- When translating VA to PA, MMU reads present bit
- If page present in memory, directly accessed
- If page not in memory, MMU raises a trap to the OS – page fault

## Assignment Project Exam Help

# Page fault handling

- Page fault traps OS and moves CPU to kernel mode
- OS fetches disk address of page and issues read to disk
  - OS keeps track of disk address (say, in page table)
- OS context switches to another process
  - Current process is blocked and cannot run
- When disk read completes, OS updates page table of process, and marks it as ready
- When process scheduled again, OS restarts the instruction that caused page fault

## Assignment Project Exam Help

# Summary: what happens on memory access

- CPU issues load to a VA for code or data
  - Checks CPU cache first (e.g., L1/L2/L3 cache)
  - Goes to main memory in case of cache miss
- MMU looks up TLB for VA
  - If TLB hit, obtains PA, fetches memory location and returns to CPU (via CPU caches)
  - If TLB miss, MMU accesses memory, walks page table, and obtains page table entry
    - If present bit set in PTE, accesses memory
    - If not present but valid, raises page fault. OS handles page fault and restarts the CPU load instruction
    - If invalid page access, trap to OS for illegal access

## Assignment Project Exam Help

# More complications in a page fault

- When servicing page fault, what if OS finds that there is no free page to swap in the faulting page?
- OS must swap out an existing and then swap in the faulting page – too much work!
- OS may proactively swap out pages to keep list of free pages handy
- Which pages to swap out? Decided by page replacement policy.

## Assignment Project Exam Help

### Page replacement policies

- Optimal: replace page not needed for longest time in future (not practical!)
- FIFO: replace page that was brought into memory earliest (may be a popular page!)
- LRU/LFU: replace the page that was least recently (or frequently) used in the past

# Assignment Project Exam Help

## Example: FIFO

- Example: 3 frames for 4 pages (0,1,2,3)
- First few accesses are cold (compulsory) misses
- Performance may get worse when memory size increases!

Access	Hit/Miss?	Evict	Resulting Cache State
0	Miss		First-in→ 0
1	Miss		First-in→ 0, 1
2	Miss		First-in→ 0, 1, 2
0	Hit		First-in→ 0, 1, 2
1	Hit		First-in→ 0, 1, 2
3	Miss	0	First-in→ 1, 2, 3
0	Miss	1	First-in→ 2, 3, 0
3	Hit		First-in→ 2, 3, 0
1	Miss	2	First-in→ 3, 0, 1
2	Miss	3	First-in→ 0, 1, 2
1	Hit		First-in→ 0, 1, 2

# Assignment Project Exam Help

## Example: LRU

- Works well due to locality of references

## Assignment Project Exam Help

Access	Hit/Miss?	Evict	Resulting Cache State
0	Miss		LRU→ 0
1	Miss		LRU→ 0, 1
2	Miss		LRU→ 0, 1, 2
0	Hit		LRU→ 1, 2, 0
1	Hit		LRU→ 2, 0, 1
3	Miss	2	LRU→ 0, 1, 3
0	Hit		LRU→ 1, 3, 0
3	Hit		LRU→ 1, 0, 3
1	Hit		LRU→ 0, 3, 1
2	Miss	0	LRU→ 3, 1, 2
1	Hit		LRU→ 3, 2, 1

## Assignment Project Exam Help

# How is LRU implemented?

- OS is not involved in every memory access – how does it know which page is LRU?
- Hardware help and some approximations
- MMU sets a bit in PTE (“accessed” bit) when a page is accessed
- OS periodically looks at this bit to estimate pages that are active and inactive
- To replace, OS tries to find a page that does not have access bit set
  - May also look for page with dirty bit not set (to avoid swapping out to disk)
